**Course Code:** CSA1013

**Slot:** B

**Course Name:** Software Engineering

**Course Faculty:** Dr. Latha R

### Project Title: AI-Powered Smart Court Case Management and Judicial Analytics Platform

#### Module Photographs:

#### Project Description:

The AI-Powered Smart Court Case Management and Judicial Analytics Platform is an intelligent digital solution designed to improve the efficiency, transparency, and organization of court case management. Courts handle many cases, legal documents, hearing schedules, evidence records, and administrative activities. Managing this information manually can result in delays, difficulties in retrieving documents, increased workload, and challenges in monitoring pending cases. This platform uses Artificial Intelligence (AI), Machine Learning (ML), Natural Language Processing (NLP), and data analytics to address these challenges.

The proposed system provides a centralized platform for registering, storing, tracking, and managing court cases. It can maintain important information such as case numbers, parties involved, case types, hearing dates, assigned judges, case status, and related documents. The system can automatically organize and classify legal documents, making information easier to search and retrieve. It can also provide notifications and reminders for upcoming hearings, deadlines, and important case activities. Natural Language Processing can also support intelligent document search and extraction of relevant information from legal records. Security mechanisms such as authentication, role-based access, encryption, and audit logs can help protect sensitive court information.
